COVID-19 and its Pandemic are the topics of today. It is very pertinent that the editors have taken up this topic that will help the medical fraternity.

The book starts with Introduction to the virus. The subsequent chapters of Epidemiology, Pathology, Immunology and Microbiology are very important for the understanding of how the virus originated and spread have been very lucidly presented. Pharmacotherapy of COVID is still not very clear. The chapter on Basic Drugs and Adjunctive Therapy gives the reader an insight on the drugs available, how and in which situations they should be used. The Summary of Clinical Trials is Adjunctive for the in depth understanding of treatment of COVID-19.

“Prevention” and “Public Health” are the crux of management of the Pandemic. These chapters highlight their importance in the management of COVID-19 the world over and give a strong message to the community.

This book has been made very interesting and will add to the reader’s clinical and practical knowledge by the many case discussions. Each case is unique and well-selected by the Editors - Acute Hearing Loss following COVID-19, Reactivation of controlled or cured diseases like Acute Lymphoblastic Leukemia, co-existence of COVID-19 with infections like Malaria, Tetanus and COVID-19 in extremes of age. It is a general consensus that the severity and fatality of COVID-19 increases in immunocompromised patients. Cases like Deceased Donor Kidney Transplant, Haematopoietic Stem-Cell Transplant, COVID-19 with an “Old” Disease in this New World will clear our concepts. The future belongs to Vaccines, Reinfection and Control of COVID-19 which is well described in the book.

This is a good book for all to read and strengthen their knowledge of COVID 19.
